

CYMBIDIUM CARE

PLACEMENT:

Cymbidiums are cool growing orchids that can be enjoyed indoors and outdoors. They often thrive on patios in temperate areas. Otherwise, a brightly-lit living room or foyer provides an ideal location.

LIGHT:

Bright light. In winter, full sun can be tolerated.

WATER AND FERTILIZER:

An active plant in full light will need to be watered weekly. Plants in low light can be watered every other week. Be sure to water thoroughly and allow plant to dry between watering. Fertilize 1x month with a growth formula (30-10-10) in the spring and summer) or a flower booster in the fall and winter (6-30-30).

TEMPERATURE:

Best range is 50-70°F while blooming. Higher temperature can cause flowers to drop off prematurely.

CONTINUING CARE:

After the last flower expires, remove the flower spike at the base. In order to re-bloom, plants need cooler temperatures and bright light.
